♣ ♣ CSCI 2500 — Computer Organization ♣ ♣ Fall 2018 Quiz 3 (October 12, 2018)

Please silence and put away all laptops, notes, books, phones, electronic devices, etc. This quiz is designed to take 25 minutes; therefore, for 50% extra time, the expected time is 38 minutes and 100% extra time is 50 minutes. Questions will not be answered except when there is a glaring mistake or ambiguity in a question. Please do your best to interpret and answer each question.

- 1. (10 POINTS) When a MIPS instruction is executed, which of the following is always true? Clearly circle the **best** answer.
 - (a) The program counter is set to the branch target address
 - (b) The pseudo-instruction is translated into an actual MIPS instruction
 - (c) The program counter is incremented by 4 bytes
 - (d) The fetch cycle fetches the target memory address
- 2. (15 POINTS) Given the three-input Boolean expression $\overline{(A+B)} \bullet \overline{(A+C)}$, what is a simpler equivalent form? Clearly circle the **best** answer.

(a)
$$\overline{A} \bullet \overline{B} \bullet \overline{C}$$

(c)
$$A \bullet B \bullet C$$

(d) $A + B + C$

(e)
$$\overline{B} \bullet \overline{C}$$

(b)
$$\overline{A} + \overline{B} + \overline{C}$$

(d)
$$A + B + C$$

(f)
$$\overline{B} + \overline{C}$$

- 3. (25 POINTS) A functionally complete set is a minimal set of operators that can be used to represent any possible Boolean expression. We know from class that AND, OR, and NOT form a functionally complete set.
 - (a) Do the two operators NOR and NAND form a functionally complete set (yes or no)?
 - (b) If "yes," describe how. If "no," describe why not (i.e., describe what's missing).

4. (50 POINTS) Translate the given C function below into a MIPS procedure labeled downcase. More specifically, input register \$a0 will contain the memory address of string s. Be sure you write a complete procedure that uses the stack properly.

You should use *Load Byte* (1b) and *Store Byte* (sb) instructions to deal with individual characters. You are allowed to use MIPS pseudo-instructions.

```
/* Change all uppercase letters in string s to lowercase, leaving all
 * other characters intact; return the number of "down-cased" characters
 *
 * ASCII: 'a' is 0x61; 'z' is 0x7a; 'A' is 0x41; 'Z' is 0x5a
 */
int downcase( char * s )
{
  int count;

  for ( count = 0 ; *s ; s++ )
    {
    if ( *s >= 'A' && *s <= 'Z' )
      {
        *s += 0x20;
        count++;
    }
}
return count;
}</pre>
```
